SYSTEM DESIGN

A routing layer with receipts.

RouteWise turns model selection into an observable control loop: attempt, verify, escalate, measure.

ROUTEWISE CONTROL LOOP

TRACEABLE

- Every transition writes to the routing trace — tokens, latency, cost, and evidence.

01

Receive the task

Start with unstructured invoice text. Every request is preserved for traceability.

02

Try the cheapest tier

Tier 1 handles the common case at the lowest configured token price.

03

Verify the evidence

Validate schema, arithmetic consistency, and whether extracted values are grounded in the source.

04

Escalate with intent

Only failed verification moves the task up the model ladder. Every decision becomes measurable.

DESIGN PRINCIPLES

Spend deliberately. Verify visibly.

- ✓ No silent escalation
- ✓ No fabricated metrics
- ✓ Configurable model ladder
